

NORTH PITTSBURGH Imaging Specialists

IODINE CONTRAST RISK AUTHORIZATION FORM

Sometimes a Radiology procedure requires an injection of contrast. Iodine contrast is administered through a small needle or IV placed into a Vein. During the administration of the contrast, you may experience the sensation of the contrast being injected or a warm feeling, which is normal and expected.

Iodine contrast is quite safe, however, as with all medications, there is a slight risk of an allergic reaction. The physicians and staff at NORTH PITTSBURGH Imaging Specialists are trained to respond to any emergency situation that may develop. In addition, we use the safest contrast media, which our radiologists believe is best for you.

I have read and understood the above information.
I have understood and answered the eligibility questions.
